An excellent student text.

By Greendreams

Malcom Hunter provides a wonderful resource for students. He brings years of experience in the academic world to create a useful and enjoyable text. His book provides broad coverage of the major topics of applied conservation including chapters on diversity, threats to biodiversity, the maintenance of biodiversity, and the human factors of conservation work. Throughout the text Dr. Hunter provides insightful illustrations and examples carefully spanning taxonomic lines and global location including several in depth case studies. This text accurately depicts the various complications and perspectives in this increasingly broad and necessary field. From the introduction through the last chapter Hunter keeps the text accessible only rarely becoming arduous to the reader's patience. Hunter leaves out the over glorified (and extremely costly) full glossy pictures that have become commonplace in modern texts making this a great buy for students. The discussion questions provided at the end of each chapter are great and his suggestions for other readings provide excellent options for students seeking to go even further into topics of interest.

Great for non-biology majors lacking otherwise

By Formicarius

There are two glowing reviews of this book but I wanted to offer a different perspective of Fundamentals of

Conservation Biology. This is my second round teaching Conservation Biology at the college level. Last year I used Groom's text Principles of Conservation Biology, Third Edition but this was too advanced and would make a great graduate-level book. This year I'm using Hunter and Gibbs and my students are finding it lacking. If only I could take the two books and create a book that is an average between the two. Hunter and Gibbs would be ideal for a conservation biology course for non-majors but for students that had ecology and ecology-related courses.

A hard to read textbook!

By rum869

I purchased this as a required textbook for a Conservation Biology class. Unfortunately, I only learned about 10% of what I needed to learn from this book. I had to read, read again, and re-read in order to understand what the author was trying to convey. It was just hard for me to read this book, as it seemed like a boring compilation of papers with constant in-text citations. I think the author/editors should research the different human learning style as this textbook seems out of balance: sensory, intuitive, visual, verbal, active, reflective, sequential, global.
